Tobacco use

- Smoking is leading cause of preventable death in the US
- Harmful effects include cancer, heart disease, lung disease
- Approximately 28 million US adults identified as current smokers in 2021

Tobacco industry spending

- Spending on cigarette advertising and promotion: \$8.01 billion in 2022

ASPiRE cities

ASPiRE cities

ASPiRE cities

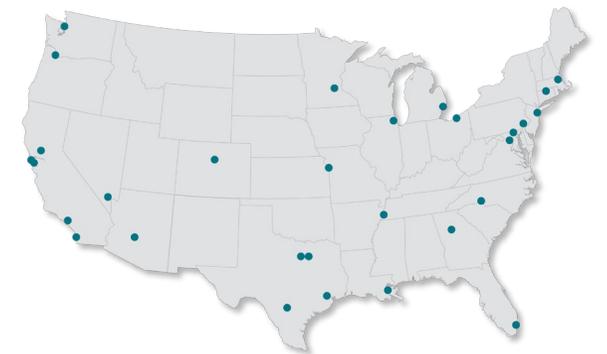

Across 30 U.S. cities there are:
31x
more tobacco retailers than McDonald's

Tobacco hotspots

- Areas with a glut of tobacco retailers
- Areas with high tobacco retailer concentration
 - High tobacco retailer density
 - Large # per square mile or per 1,000 people
 - High tobacco retailer proximity
 - Large % of population within a 5- or 10-minute walk to a retailer
 - Short median distance from residents to retailers, e.g., 500m, 1000m
 - Proximity \neq Density

Retailer concentration in ASPIRE cities

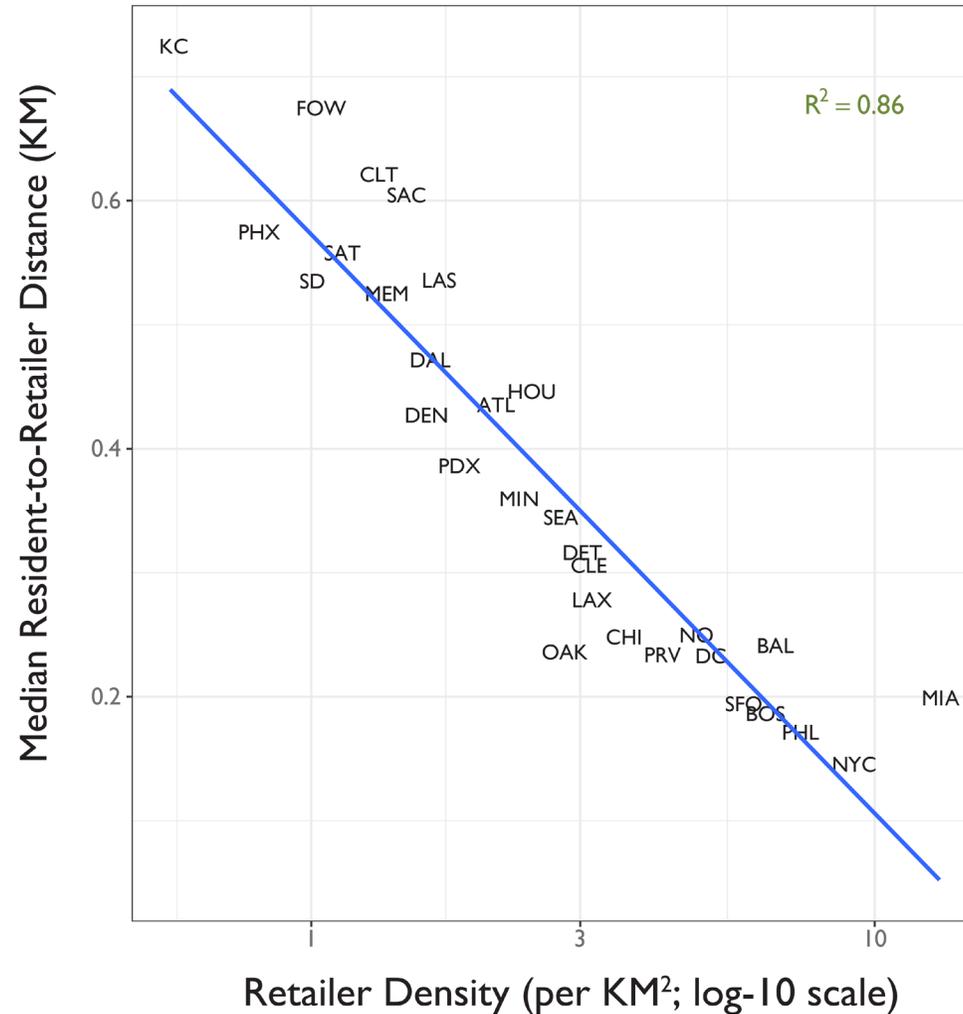

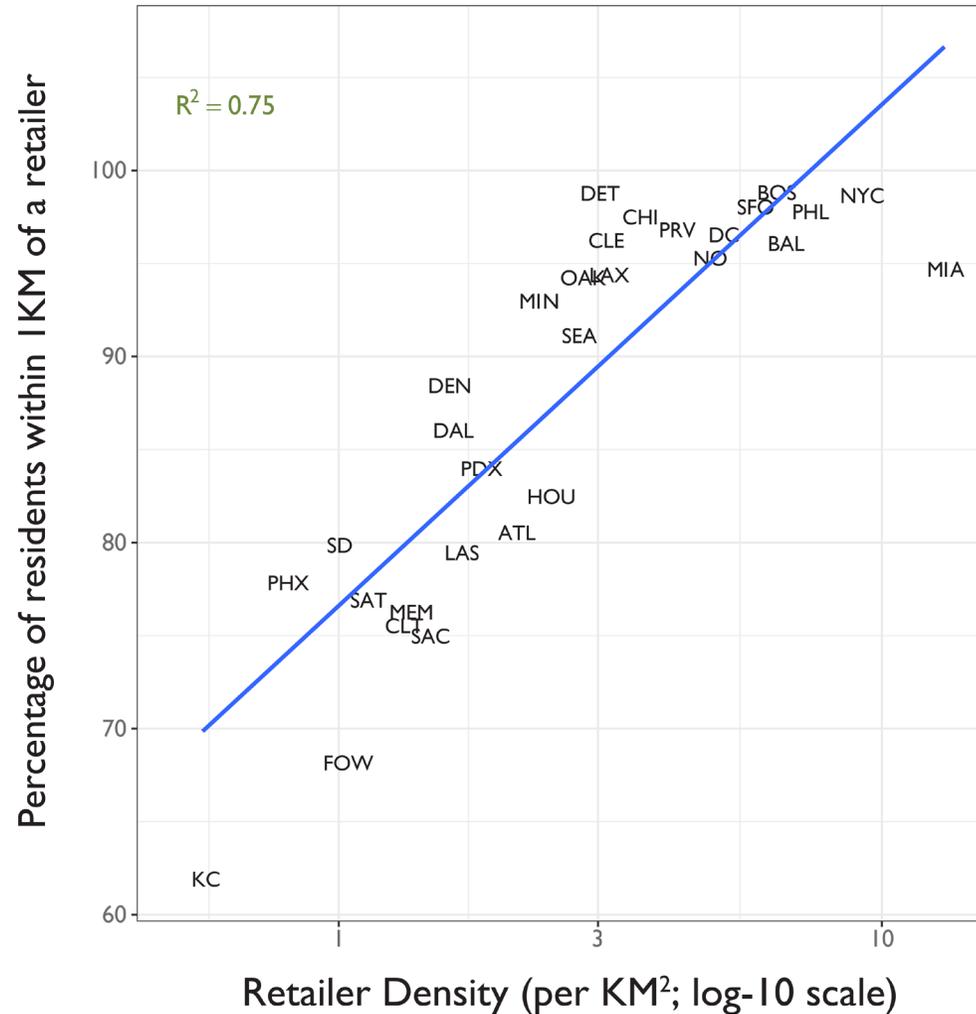

- Goals
 - Compare measures of tobacco retailer density and resident-to-retailer proximity in the 30 cities
 - Compare the impact of retail policies on density and proximity
 - Consider the importance of context for policy impact

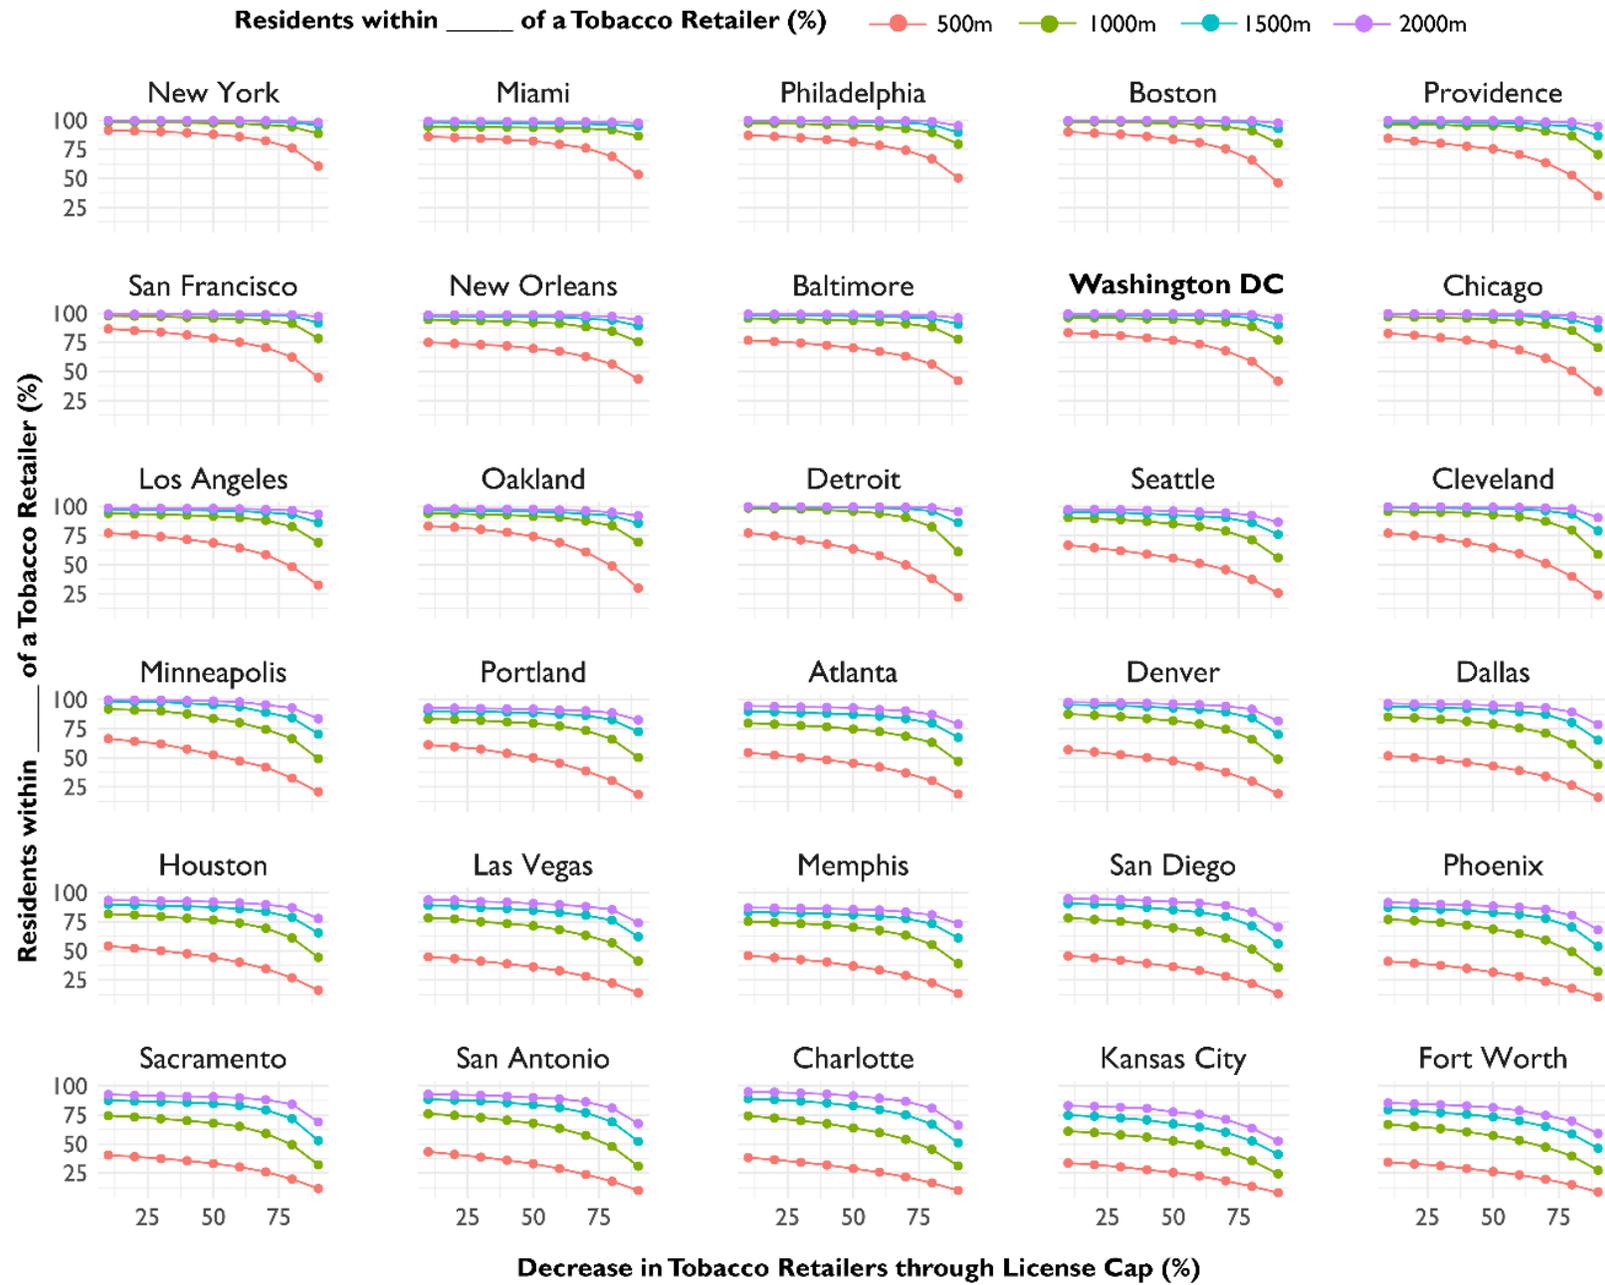

Retail policy simulations

- License Cap (LC)
- Retailer-to-Retailer Buffer (R2R)
- School-to-Retailer Buffer (S2R)

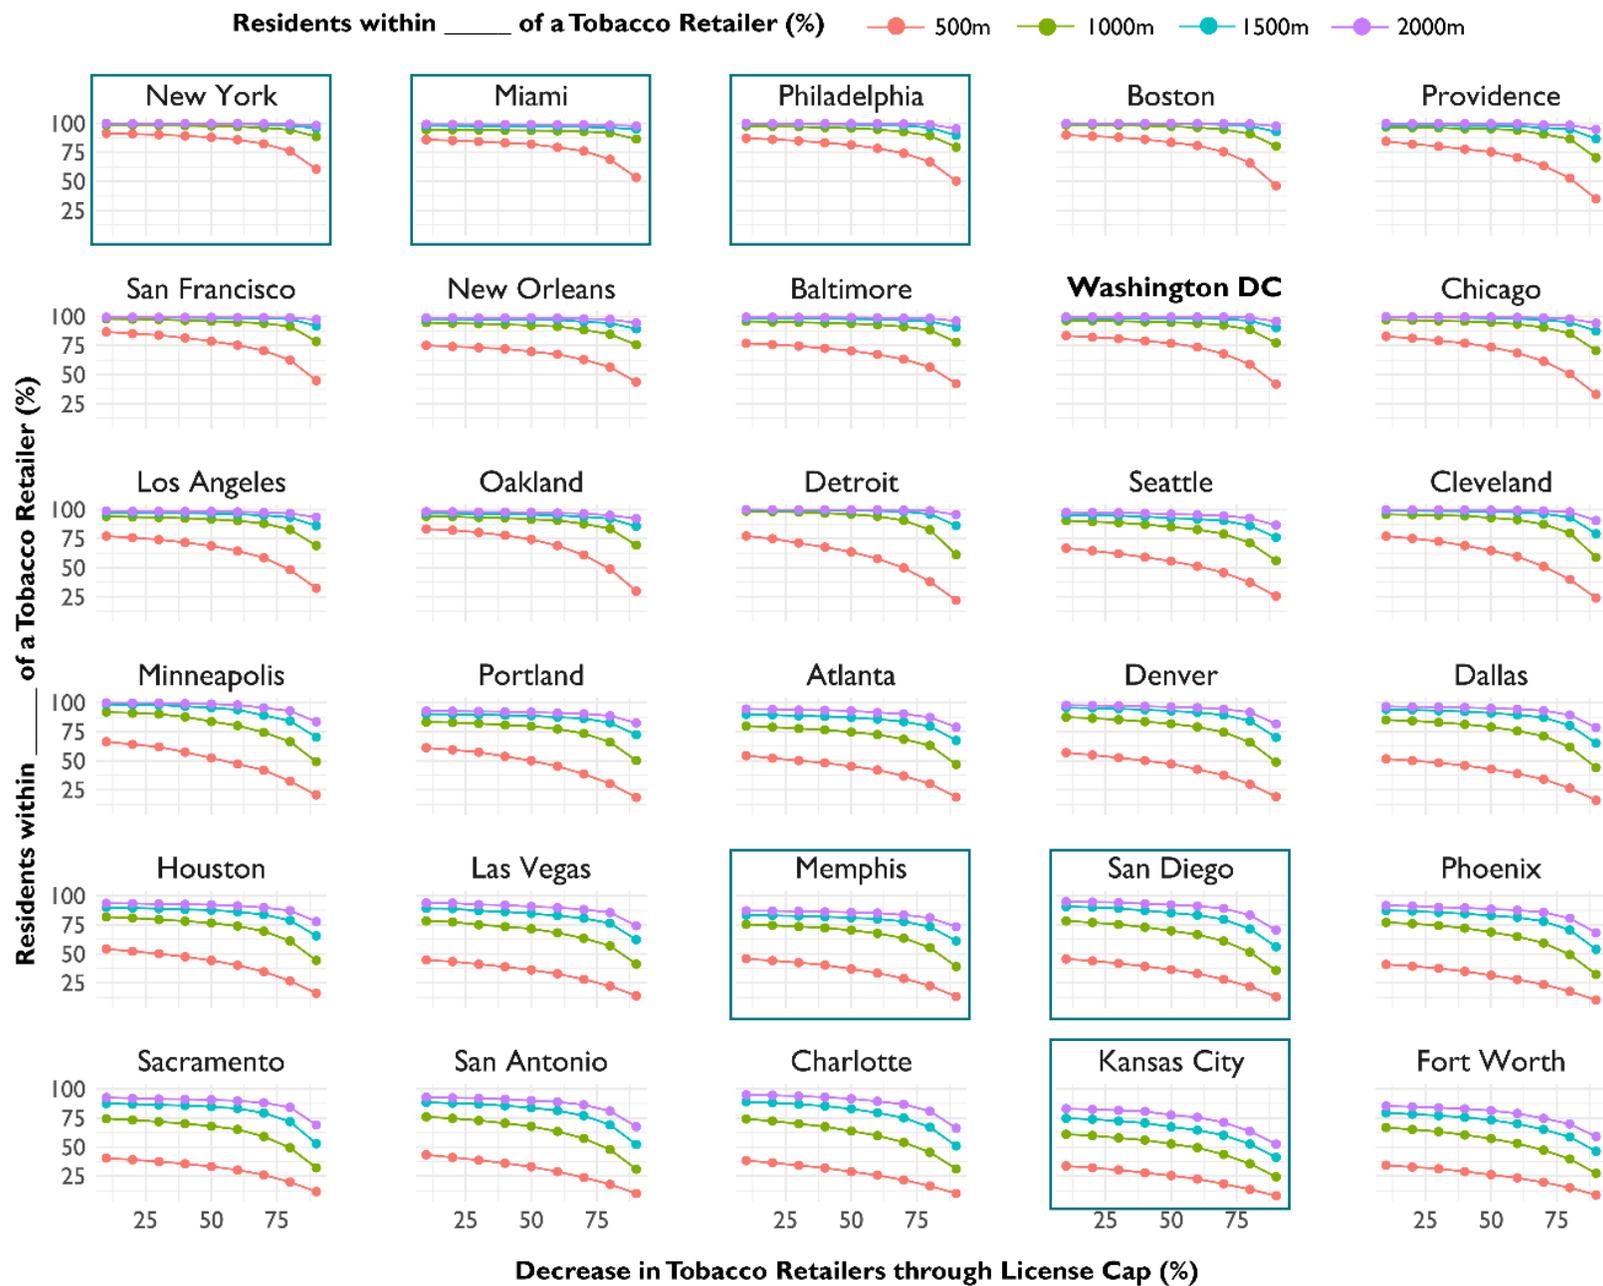

Retailer concentration in ASPIRE cities

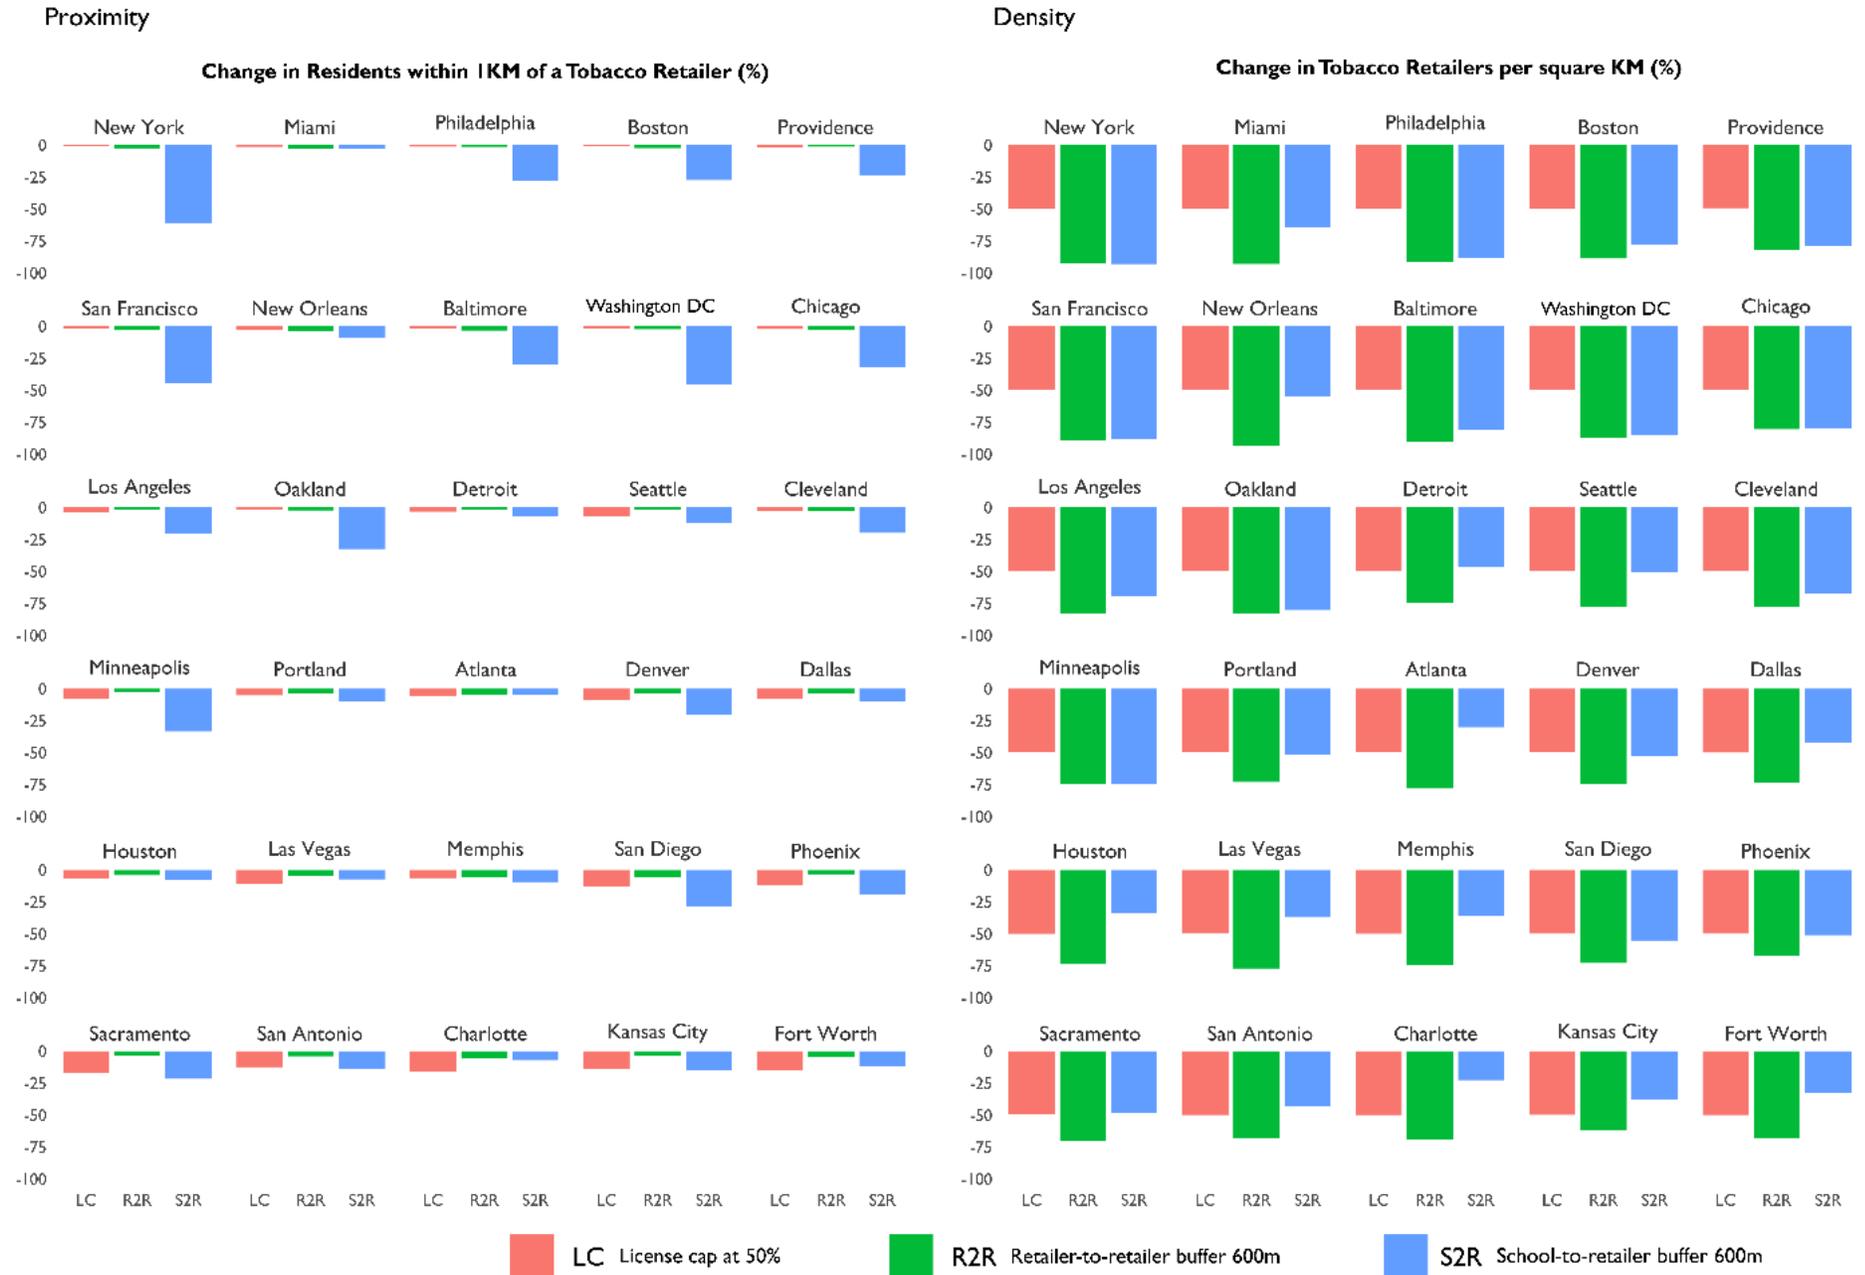

Policy impact on proximity

Policy impact on proximity

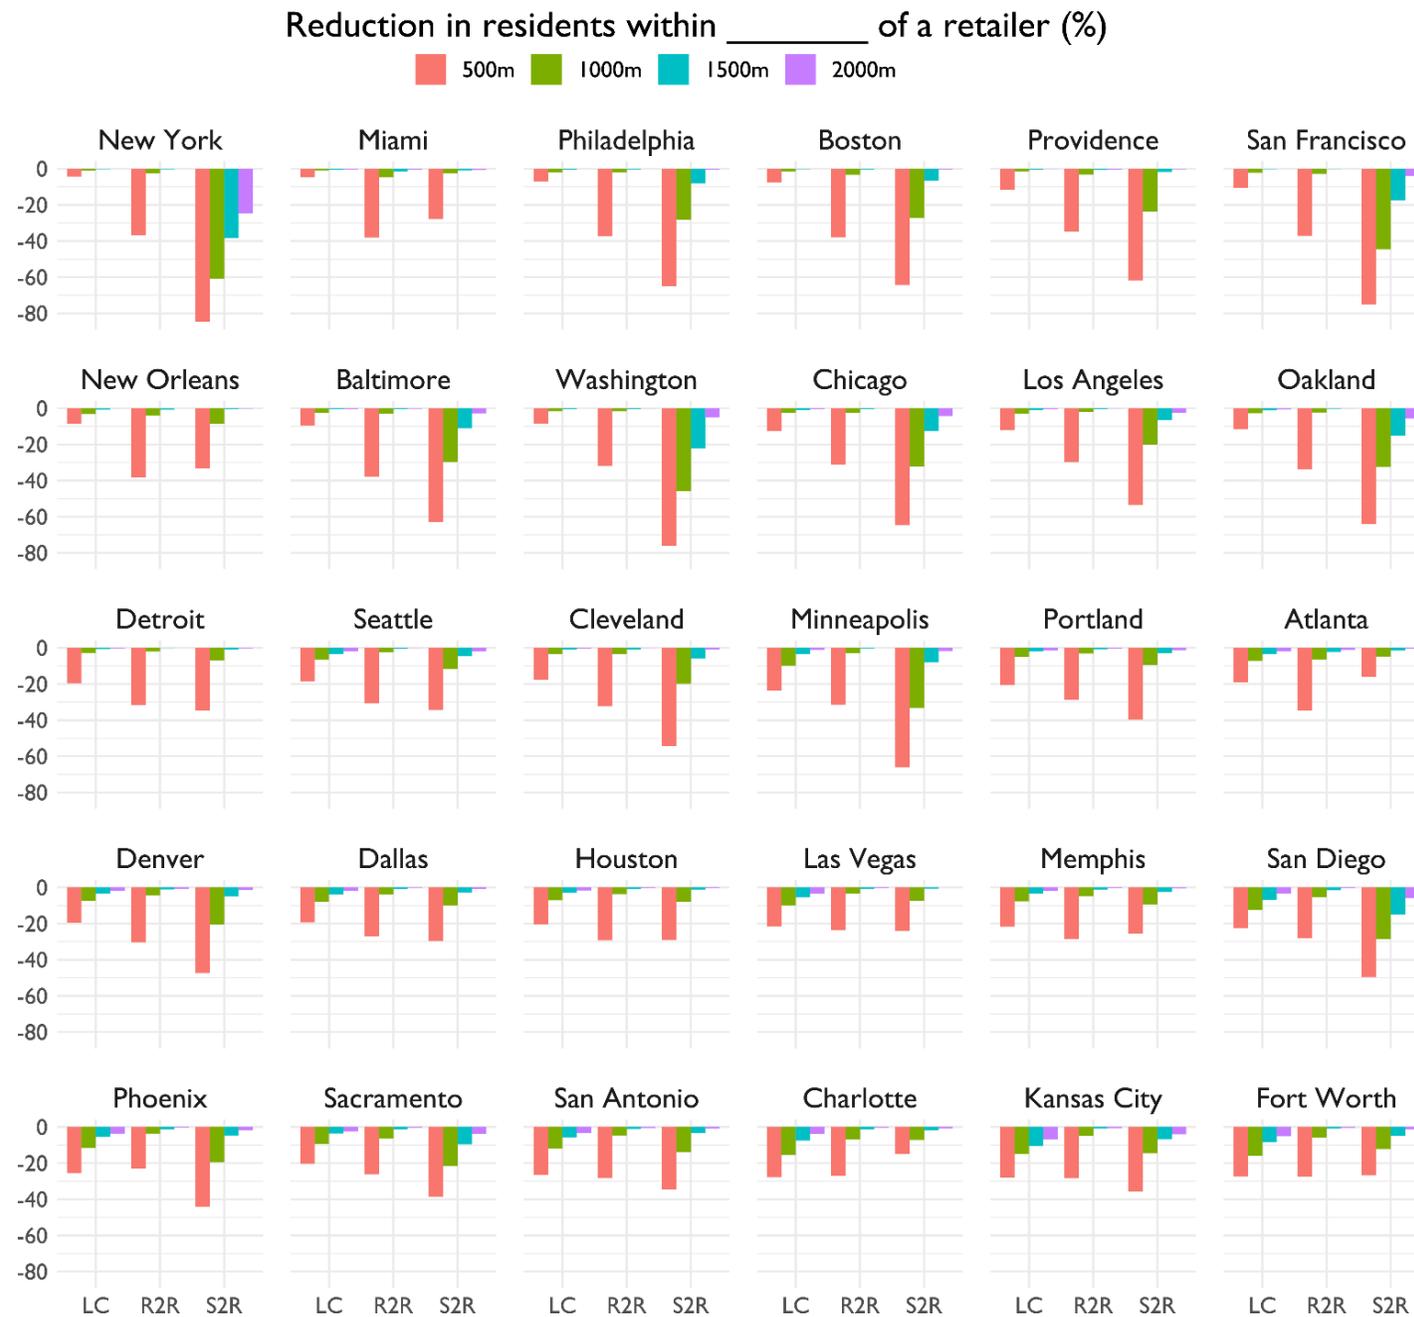

Policy impact on proximity and density

Policy impact on proximity and density

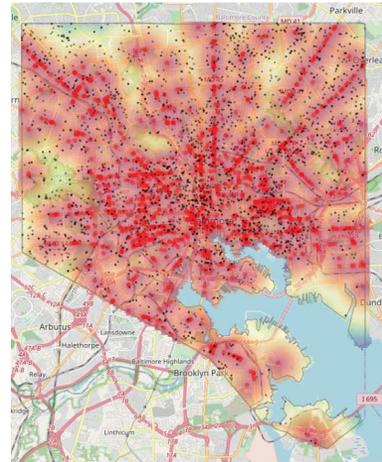

Policy impact on proximity at different levels

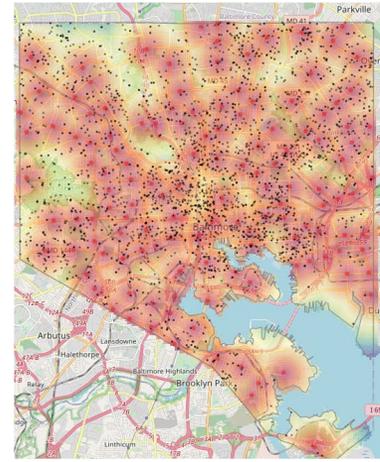

Policy impact on proximity and density: take 2

Baltimore Baseline

Density 5.80/km²
 Median proximity 0.24 km
 Residents within 1km 96%

License cap 50%

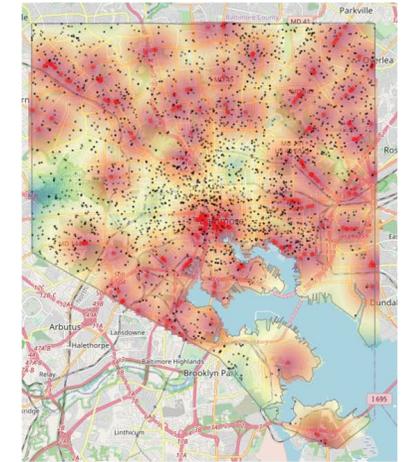

Density 2.90/km²
 Median proximity 0.31 km
 Residents within 1km 94%

Retailer-to-retailer buffer 600m

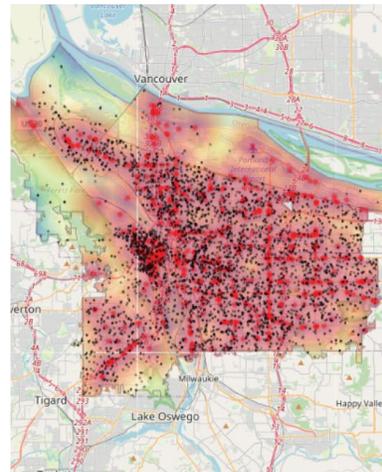

Density 0.56/km²
 Median proximity 0.51 km
 Residents within 1km 93%

School-to-retailer buffer 600m

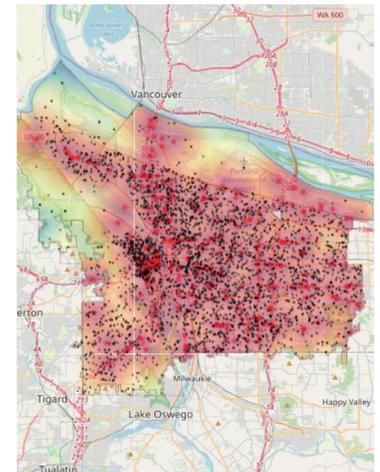

Density 1.1/km²
 Median proximity 0.74 km
 Residents within 1km 68%

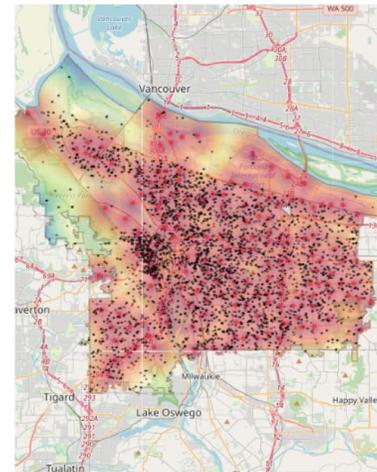

Portland

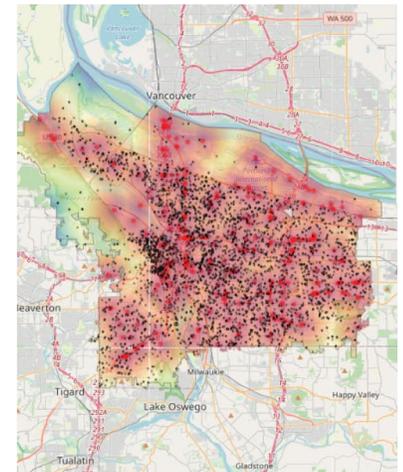

Density 1.66/km²
 Median proximity 0.39 km
 Residents within 1km 84%

Density 0.83/km²
 Median proximity 0.51 km
 Residents within 1km 80%

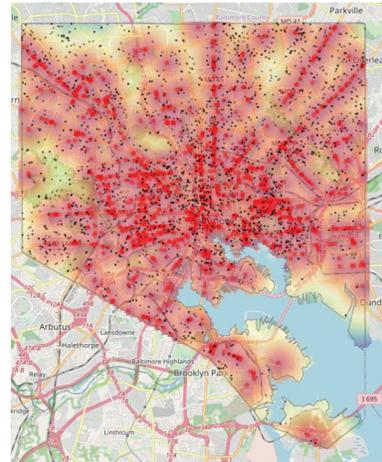

Density 0.45/km²
 Median proximity 0.55 km
 Residents within 1km 81%

Density 0.80/km²
 Median proximity 0.63 km
 Residents within 1km 76%

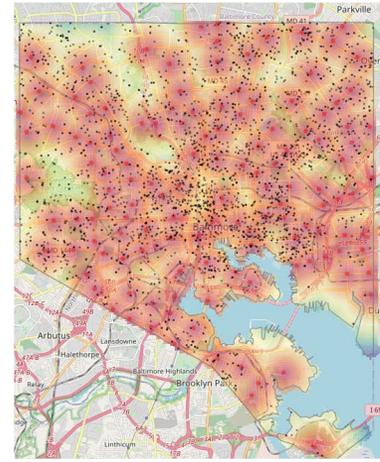

Policy impact on proximity and density: take 2

Baltimore Baseline

Density 5.80/km²
 Median proximity 0.24 km
 Residents within 1km 96%

License cap 50%

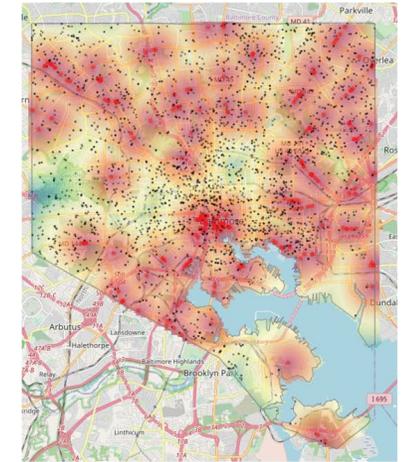

Density 2.90/km²

Key takeaways

- Proximity \neq Density
 - And the impact of policies is different
- Context is important
 - Baseline built environment for tobacco matters
 - Other factors likely matter as well
- Policymakers should know that policies will affect the measures differently
 - Plan for this for gauging policy successes
 - Different measures, e.g., proximity of retailers to schools, may resonate differently across groups

Next steps

- Simulations with a focus on equity
 - We know there are racial, ethnic, and economic disparities in tobacco retailer density and resident-to-retailer proximity
 - There are differential impacts across groups and communities from retailer reduction policies as well
 - For example, how does a 600m (~2000ft) school-to-retailer buffer affect low-income communities as compared to higher-income ones, or communities of color and predominately non-Hispanic white communities, in terms of tobacco retailer density and proximity reductions?
 - Aside from traditional sociodemographics, there are structural measures of equity we investigate and compare: social capital index, social vulnerability index, entropy index, etc.

Questions from CADCA

- Have you started additional research on this topic?
- Who have you presented your findings to and who would you want to reach?
- How can coalitions and substance use preventionists in the field best use the findings from your research?
